# Sprint-01

Signs with Smart Connectivity for Better Road Safety

TeamID-PNT2022TMID0734

###SprintGoals:

1. Create and initialize accounts in various public

APIs like Open Weather API.

2. Write a Python program that outputs results

given the inputs like weather and location.

###CodeFlow :

Program Code

:(./weather.py)

This file is a utility function that fetches the weather from OpenWeatherAPI. It returns only certainrequiredparametersof theAPI response.

```python
#Pythoncode

importrequestsasreqs

defget(myLocation,APIKEY):
    apiURL =
    f"https://api.openweathermap.org/data/2.5/weather?q={myLocation}&appid={APIKEY}"response
    JSON= (reqs.get(apiURL)).json()
    returnObject={
        "temperature" : responseJSON['main']['temp'] -
        273.15,"weather":[responseJSON['weather'][_]['main'].lower()for
        _in
range(len(responseJSON['weather']))],
        "visibility": responseJSON['visibility']/100, # visibility in percentage where 10km is 100%
and0kmis0%
    }
    if("rain"inresponseJSON):
        returnObject["rain"] = [responseJSON["rain"][key] for key in
    responseJSON["rain"]]return(returnObject)
```

(./brain.py)

> This file is a utility function that returns only essential information to be displayed at the hardwareside andabstracts alltheunnecessarydetails.Thisiswherethecodeflow logicisimplemented.

```python
#Pythoncode

#IMPORTSECTIONSTARTS

importweather
fromdatetime importdatetimeasdt
```

```python
#IMPORTSECTIONENDS
#...............................................
#UTILITYLOGICSECTIONSTARTS
defprocessConditions(myLocation,APIKEY,localityInfo):
    weatherData=weather.get(myLocation,APIKEY)

    finalSpeed = localityInfo["usualSpeedLimit"] if "rain" not in weatherData
elselocalityInfo["usualSpeedLimit"]/2
    finalSpeed=finalSpeedifweatherData["visibility"]>35elsefinalSpeed/2

    if(localityInfo["hospitalsNearby"]):
        # hospital
        zonedoNotHonk=True
    else:
        if(localityInfo["schools"]["schoolZone"]==False):
            # neither school nor hospital
            zonedoNotHonk= False
        else:
            # schoolzone
            now=[dt.now().hour,dt.now().minute]
            activeTime = [list(map(int,_.split(":"))) for _ in
            localityInfo["schools"]["activeTime"]]doNotHonk=activeTime[0][0]<=now[0]<=activ
            eTime[1][0] and
activeTime[0][1]<=now[1]<=activeTime[1][1]

    return({
        "speed" :
        finalSpeed,"doNotHonk":doNo
        tHonk
    })

#UTILITYLOGICSECTIONENDS
```

(./main.py)

> The code that runs in a forever loop in the micro-controller. This calls all the util functions fromotherpythonfilesandbasedonthereturnvaluetransduceschangesintheoutput hardwaredisplay.

```python
#Pythoncode

#IMPORTSECTIONSTARTS

importbrain

#IMPORTSECTIONENDS
#
#USERINPUTSECTIONSTARTS

myLocation="Chennai,IN"
APIKEY="bf4a8d480ee05c00952bf65b78ae826b"

localityInfo =
  {"schools":{
    "schoolZone":True,
    "activeTime":["7:00","17:30"]#schoolsactivefrom7AMtill5:30PM
    },
  "hospitalsNearby" :
  False,"usualSpeedLimit":40#inkm
  /hr
}

#USERINPUTSECTIONENDS
#
#MICRO-CONTROLLERCODESTARTS
```

print(brain.processConditions(myLocation,APIKEY,localityInfo))

'''

MICRO CONTROLLER CODE WILL BE ADDED IN SPRINT 2 AS PER OUR PLANNED SPRINT
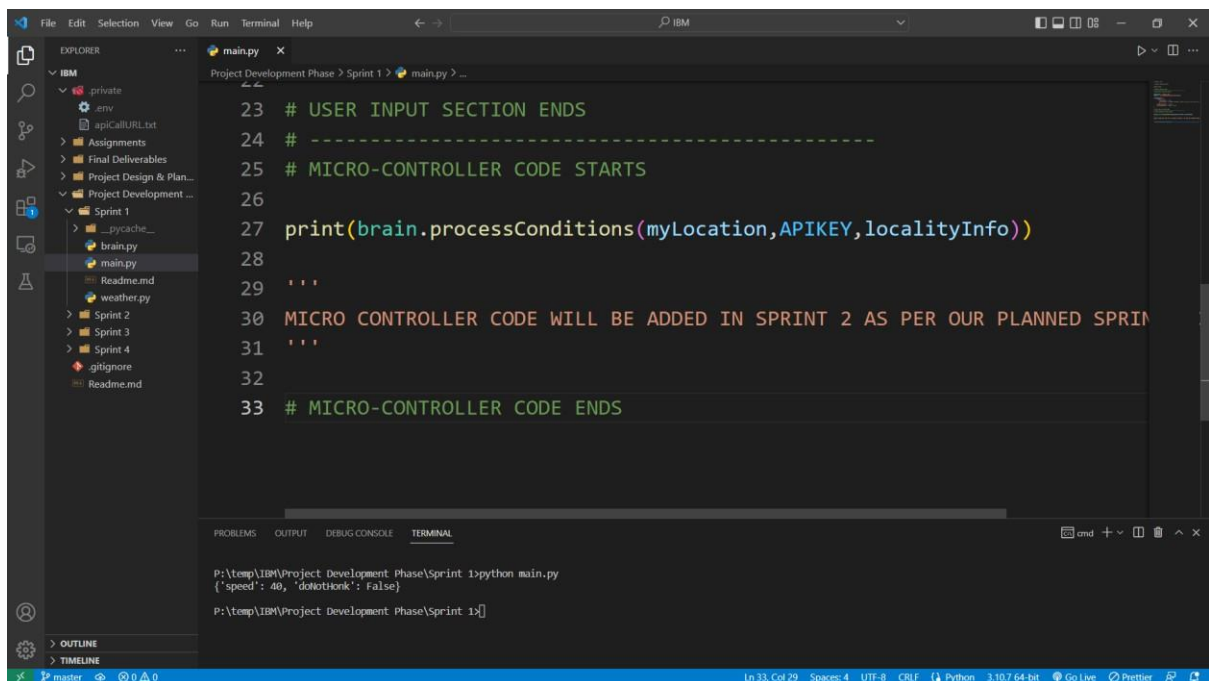

SCHEDULE'''

#MICRO-CONTROLLERCODEENDS

```

Output:

```python
#CodeOutput
{'speed':40,'doNotHonk':False}
```
